

SearchSploit – The Manual

Included in our [Exploit Database repository on GitLab](#) is *searchsploit*, a command line search tool for Exploit-DB that also allows you to take a copy of Exploit Database with you, everywhere you go. SearchSploit gives you the power to perform detailed off-line searches through your locally checked-out copy of the repository. This capability is particularly useful for security assessments on segregated or air-gapped networks without Internet access.

Many exploits contain links to binary files that are not included in the standard repository but can be found in our [Exploit Database Binary Exploits repository](#) instead. If you anticipate you will be without Internet access on an assessment, ensure you check out both repositories for the most complete set of data.

This guide is for version 4 of SearchSploit. Note, The name of this utility is Search**Sploit** and as its name indicates, it will search for all exploits and shellcode. It will not include any results for [Google Hacking Database](#), but it can include [Papers](#) if configured (correctly).

How to Install SearchSploit

[Linux](#)[macOS/OS X](#)[Windows](#)[Git](#)

Kali Linux

If you are using the standard GNOME build of [Kali Linux](#), the *exploitdb* package is already [included by default](#)! However, if you are using the Kali Light variant or your [own custom-built ISO](#), you can install the package manually as follows:

```
kali@kali:~$ sudo apt update && sudo apt -y install exploitdb
```

You may wish to install some other related packages: **exploitdb-papers** and **exploitdb-bin-sploits**.

Linux

If you are not using Kali Linux, the *exploitdb* package may not be available through the package manager in which case, you can continue by following the instructions under the 'Git' tab.

Updating SearchSploit

If you are using Kali Linux, you can expect the *exploitdb* package to be [updated weekly](#). If you are using Homebrew or Git, you can expect [daily updates](#) (at 05:05 UTC). Regardless of how you installed SearchSploit, all you need to do in order to update it is run the following:

```
$ searchsploit -u
```

If you are using the Kali Linux package and haven't updated since before 20 September 2016 (shame on you), you will first need to update the package in the traditional manner:
